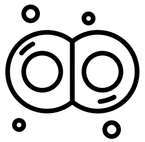
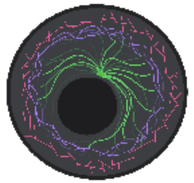
A real biological knob! Weak magnetic fields control physiology: 40+ years of widespread, organism- and cell type-agnostic correlative data *consistent with electron spin-dependent chemical reactions*

weak magnetic fields (≈ cell phone strength!) can up- and down-regulate, among others:

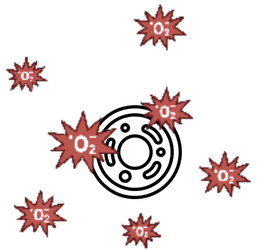


cell proliferation

respiration
& metabolism



migration
& cytoskeleton



oxidative stress

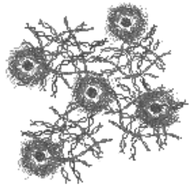
ion channel
functioning

embryogenesis

regeneration
& differentiation

DNA repair
& methylation

oxidative
phosphorylation



τ protein
aggregation

still curious? 25-page compilation of effects: bit.ly/MFEbiology
